

Climate Sensitivity

Scope for Theory

- What level of uncertainty can be expected?
 - Is the climate structurally stable?
- Propagation of uncertainty through the system.
 - What processes are key?
 - ★ Clouds? Land-ice? Ocean heat uptake?
 - Do feedbacks really matter?
- Are the observational constraints sufficient?
 - Levels of aerosols in 20'th century?
 - Climate variations and sensitivity in the past.

(There are activities in some of these areas, fortunately.)
